

Do this CONflit Example

=====

=====

Another Example = MERGE CONFLIT - when we merge 2 branches with same files

=====

```
mkdir abcd
cd abcd
git init
```

```
vi index.html
I am dev1 writing java on branch-1
git add index.html
git commit -m "dev1-commits" index.html
```

```
git branch
```

```
git branch -m master branch1 --> renaming master to branch1 (just for clarity)
```

```
git branch
```

```
git checkout -b branch2 --> this will create a new branch from master
```

```
vi index.html
I am dev2 writing python on branch-2
git add index.html
git commit -m "dev2-commits" index.html
```

```
git branch
*branch2
cat index.html
```

```
git checkout branch1
ls
cat index.html
vi index.html
add some line
git add index.html
git commit -m "dev1-newline-commits" index.html
```

Now in both branches we have same index.html --> see files ,

```
git merge branch2 -> error: conflit
```

```
git diff index.html
```

```
cat index.html
```

--- Now resolve conflit manually by developer, because he know what can be kept and removed

```
vi index.html
delete dev2 code
git add index.html
git commit -m "new-commits" [dont give filename]
git status
```
